Fact fluency (being able to instantly recall facts without the need for working out) is extremely important for children's success in mathematics. To become competent and confident mathematicians, children need to be able to recall each of the addition facts below in approximately 3 seconds. Once children have fact fluency, they "free up their working memory so that they can focus on solving the actual problem" (NCETM, 2017).

Please can you support your child by helping them learn these recall facts.
